Indonesia - Dual Band Access Points can now be approved

Following SPDDI's notification earlier this year that access points are allowed to be tested and approved for use on dual bands, RisTi Lab in Indonesia has confirmed they are now authorized to perform testing of dual band access points.

Such a move means access points are now practically permitted to be approved for use in both the 2.4GHz and 5.8GHz bands.

Please note SDPPI's own lab currently still does not conduct testing on dual band Access Points.
